

The ou-tma and ou-tma-sup Packages*

Geoff Riley
geoffr@adaso.com

2025-11-19 (v1.21.5), 2025-11-25 (v0.14)

Abstract

The `ou-tma` package provides macros and environments to assist in writing Tutor Marked Assessments (TMAs) for Open University courses. The companion file `ou-tma-sup` package provides a number of extra macros that may be useful for some modules.

1 Introduction

The `ou-tma` package simplifies the creation of TMAs by providing an environment to encompass answers to questions commands to enumerate parts and subparts of those questions, and a set of macros facilitating mathematical entry based on the styles used by the Open University (OU).

2 Compiling and installing ou-tma

To compile the `ou-tma` package (extract the `.sty` files):

```
Enter ⇒ pdflatex tma.ins
```

To compile the `ou-tma` documentation:

```
Enter ⇒ pdflatex ou-tma.dtx
```

(several times)

```
Enter ⇒ makeindex -s gglo.ist -o ou-tma-chg-tma.gls ou-tma-chg-tma.glo
```

```
Enter ⇒ makeindex -s gglo.ist -o ou-tma-chg-sup.gls ou-tma-chg-sup.glo
```

```
Enter ⇒ makeindex -s gglo.ist -o ou-tma-chg-chg.gls ou-tma-chg-chg.glo
```

```
Enter ⇒ makeindex -s gind.ist ou-tma
```

```
Enter ⇒ pdflatex ou-tma.dtx
```

(several times)

The files `ou-tma.sty` and `ou-tma-sup.sty` should be placed in an appropriate location within the $\text{\TeX}$ directory structure. For example in a directory such as `tex/latex/ou-tma`. The file `doc-changes.sty` is only used for formatting this documentation and may safely be ignored thereafter.

3 Usage

To use the `ou-tma` package, in its most basic form, it should be included in the preamble of your $\text{\LaTeX}$ document:

```

\documentclass[a4paper,11pt]{article}
\usepackage[\options]{ou-tma}
\usepackage{ou-tma-sup}      % if required
:
\begin{document}
:
\end{document}

```

3.1 Options

A number of options are available to modify the results of using the **ou-tma** package. These should be included within the `\usepackage` declaration:

```
\usepackage[\option,...]{ou-tma}
```

The following options are available:

`alph` (*Opt*) **alph**: (default) question numbering as 1(b)(iii);
[package options]
`roman` (*Opt*) **roman**: varies question numbering to sequence used by M381 i.e. 1(ii)(c);
[package options]
`cleveref` (*Opt*) **cleveref**: question numbering creates automatic referencing for use with cleveref
[package options] package;
`pdfbookmark` (*Opt*) **pdfbookmark**: add PDF bookmarks for each question using hyperref package; and
[package options]
`legacy` (*Opt*) **legacy**: enables old definitions of `\vec` and `\C` for backward compatibility.
[package options]

3.2 Macros and environments

The **ou-tma** package provides several valuable macros and environments, most are documented here.

3.2.1 Document level commands

The document-level commands are intended for use within the document's preamble. They generally affect what appears on the title page and the headers/footers.

The most essential part of an assignment is to identify who it has been written by and what it has been written for. To this end, the `\myname` macro is used to specify your name: this should be your name as recorded with the University. As names are not unique, the OU allocates a Personal Identification Number (or PIN) as a unique identifier for each student; this should be declared with the `\mypin` macro. It is formed by a letter, followed by seven digits—or six digits and a letter X. This

is distinct from the OUCU, or OU Computer User identifier that is used to log in to the OU website.

Once the personal identification has been done, the module being worked needs to be declared, the course code of your module should be given with the `\mycourse` macro and the number of the assignment using the `\mytma` macro. Note that this is just the assignment number; there is no need to include the characters **TMA**.

The final document level command is used if you wish to set a specific date that will be displayed on the compiled document title page; you may use `\setdate`. This will override the default of using the compile date.

Example:

```
\myname{Anthony Neil Other}
\mypin{A1234567}
\mycourse{M101} % The original Maths introduction module
\mytma{02} % TMA02
\setdate{March 2025}
```

3.2.2 Question environment commands

These commands are the ones that, though few, comprise the bulk of the body of the TMA answer content of a paper.

question (*env.*) Within a TMA, each answer should be placed in a **question** environment. The question number is printed across the left margin, preceded by the question string which defaults to ‘Q’ but may be redefined by use of the command `\setquestionstring` `\setquestionstring[⟨alignment⟩]{⟨required question number introduction⟩}`. By setting *alignment* to ‘l’ it is possible to left align the question string and number from the margin rather than into it, this is particularly useful for languages where the translation of ‘Question’ is long enough to disappear past the left hand edge of the page: the default is ‘r’ for right aligned. The question number itself is automatically incremented unless one is specified in the optional parameter. Since the question is presented as an environment, it may be convenient to place each question in a separate file to be included in the main paper.

\qpart [question] Often questions are comprised of multiple parts, therefore, **\qpart** indicates the start of a question part. It will set the part identifier within the left-hand margin space. Normally, the parts are lettered as a, b, c... unless the option **roman** has been given to the **ou-tma** package when the parts are numbered as i, ii, iii... As with the actual questions, this is an auto-incrementing value unless an optional value is given. Note that the value should be numerical even if the parts are lettered or in Roman numerals. Each new question restarts the numbering at 1, which will be rendered as a or i as dictated by the options in effect.

There are frequent occasions that the parts of questions may be further divided into sub-parts; these may be declared using the **\qsubpart** macro. As with **\qpart**, this is set in the left margin and automatically incremented: an option to choose the sub-part number is also available. If a **\qsubpart** immediately follows a **\qpart**, both marginal markers will be set on the same line.

Infrequently, there may arise the need for alternative questioning paths. This is most frequently the case when there has been some form of practical that may not be feasible for all students to take part in. Under these circumstances questions get issued with tracking version, so there will be a question line ‘1’ and a question line ‘2’, to accommodate these the `\qsubparte` macro is made available. As with the standard `\qsubpart` macro, it may be followed by an optional number to restart the sequence, but it has, in addition, a required parameter to give the track number. *This is included in the `ou-tma-sup` package.*

`\qsubparte` [question]

Note that `question` is an environment to be used with the `\begin... \end` structure, `\qpart`, `\qsubpart` and `\qsubparte` are all macros that lay down markers in the margin, and are designed to be used within the `question` environment on their own.

Example:

```
\begin{question}[\langle question number \rangle]
:
\qpart[\langle part number \rangle]
:
\qsubpart[\langle sub-part number \rangle]
:
\qsubparte[\langle sub-part number \rangle]{\langle postfix track number \rangle}
:
\end{question}
```

3.2.3 Mathematical symbology

Various mathematical symbols and elements are defined for convenience, working from the normal suggested formats used within Open University courses. These are mostly as proscribed by the various standards bodies too, for reference see “Quantities and units - Part 2: Mathematics” ISO 80000-2:2019*

These commands are created in such a manner that they will work correctly in both text and maths modes.

\dd Differential operators The general advice for most OU modules is to use an upright letter ‘d’ when specifying differential variables, thus `\dd` is provided to allow simple accommodation of this. Similarly, Euler’s number and the imaginary unit representation of $\sqrt{-1}$ are both usually given upright letters of ‘e’, (`\e`), and ‘i’, (`\ii`), respectively.

Note

* Available from British Standards Online as BS EN ISO-2:2019 (ISBN 978 0 539 23108 3), The European Standards Agency and The International Standard Organisation. All are purchasable publications.

Remember that it is the exception that proves the rule: always follow the the module guidebook for course being completed.

Example 1: Differential

Code:

In display mode, compare `\dd\` with `$d$`:
`\[`
`\frac{\dd^2 y}{\dd x^2} + x\frac{\dd y}{\dd x} + y = 2\sin(x)\`
`\]`
 and in line mode `$\e^{\ii x} = \cos(x) + \ii\sin(x)$`

Result:

In display mode, compare `d` with `d`:

$$\frac{d^2y}{dx^2} + x\frac{dy}{dx} + y = 2\sin(x)$$

and in line mode `eix = cos(x) + isin(x)`

Number sets Standard ‘black-board’ fonts are used to indicate a number of frequently designated groups of numbers.

<code>\N</code>	<code>\N</code> : $\mathbb{N}$ represents all natural numbers;
<code>\Z</code>	<code>\Z</code> : $\mathbb{Z}$ represents all integers;
<code>\Q</code>	<code>\Q</code> : $\mathbb{Q}$ represents all rational numbers;
<code>\R</code>	<code>\R</code> : $\mathbb{R}$ represents all real numbers; and
<code>\Complex</code>	<code>\Complex</code> : $\mathbb{C}$ represents all complex numbers.

Example 2: Number sets

Code:

The relationship between number sets:
`\begin{itemize}`
`\item \N\ (Natural numbers) $\subseteq \Z$ (Integers);`
 every natural number is also an integer.
`\item \Z\ (Integers) $\subseteq \Q$ (Rational numbers);`
 every integer is also a rational number.
`\item \Q\ (Rational numbers) $\subseteq \R$ (Real`
 numbers); every rational number is also a real
 number.
`\item \Complex\ (Complex numbers) $\supseteq \R$ (Real`
 number); complex numbers include real numbers as
 a subset, since they can be represented by
 `$a+\ii b$` where `$a$` and `$b$` are real numbers.
`\end{itemize}`

Result:

The relationship between number sets:

- $\mathbb{N}$ (Natural numbers) $\subseteq \mathbb{Z}$ (Integers); every natural number is also an integer.
- $\mathbb{Z}$ (Integers) $\subseteq \mathbb{Q}$ (Rational numbers); every integer is also a rational number.
- $\mathbb{Q}$ (Rational numbers) $\subseteq \mathbb{R}$ (Real numbers); every rational number is also a real number.
- $\mathbb{C}$ (Complex numbers) $\supseteq \mathbb{R}$ (Real number); complex numbers include real numbers as a subset, since they can be represented by $a + ib$ where a and b are real numbers.

\vect **Vector notation** Two different vector representations are typically used on OU modules, there is the two, or more, letter with an over arrow version given with **\vect**; and the emboldened upright letter version **\ve**—the latter is commonly handwritten as an underlined letter.

Example 3: Vectors

Code:

Given a point A at the co-ordinate $(6, 3)$ and a point B at the co-ordinate $(-4, 8)$, the vector $\vec{AB}$ has a gradient of $\frac{8-3}{-4-6} = \frac{5}{-10} = -\frac{1}{2}$. The standard unit vectors are $\mathbf{i}$ and $\mathbf{j}$. They are usually at right angles to each other.

Result:

Given a point A at the co-ordinate $(6, 3)$ and a point B at the co-ordinate $(-4, 8)$, the vector $\overrightarrow{AB}$ has a gradient of $\frac{8-3}{-4-6} = \frac{5}{-10} = -\frac{1}{2}$. The standard unit vectors are $\mathbf{i}$ and $\mathbf{j}$. They are usually at right angles to each other.

\st **Ordinal indicators** The use of ordinal indicators is not specific to OU modules, but frequently is a useful element that is just inconvenient to produce.

\nd

\rd So the standard four English ordinals are provided **\st**, **\nd**, **\rd**, and **\nth**, e.g. 1st, 2nd, 3rd, and 4th.

\nth Note that the last ordinal is **\nth** not **\th**, the latter produces a thorn character, þ, and that only works if you have other than the default 7-bit font encoding (OT1).

Combinatorial notations There are two combinatorial forms that are commonly used in OU modules, the combination selecting r out of a total of n items where order does not matter, and the permutations of r out of n items where order matters.

\comb **\comb:** $\{\langle n \rangle\}\{\langle r \rangle\}$. This is equivalent to

$${}^nC_r = \frac{n!}{r!(n-r)!}$$

`\perm` `\perm: {\langle n \rangle}{\langle r \rangle}`. This is equivalent to

$${}^nP_r = \frac{n!}{(n-r)!}$$

Group theory Some awkward to enter elements are defined here to help typeset various group notations.

`\gen` `\gen: {\langle x \rangle}`. This represents a cyclic group generated by x . Rendered as $\langle x \rangle$.

`\0rd` `\0rd: {\langle G \rangle}`. This represents the order of group G . Rendered as $|G|$.

Mathematical operators Additional mathematical operators are defined, again for convenience of entry.

`\re` `\re: \mapsto \text{Re}`

`\im` `\im: \mapsto \text{Im}`

`\Log` `\Log: \mapsto \text{Log}`

`\Arg` `\Arg: \mapsto \text{Arg}`

`\Wnd` `\Wnd: \mapsto \text{Wnd}`

`\Res` `\Res: \mapsto \text{Res}`

`\Ker` `\Ker: \mapsto \text{Ker}`

`\0rb` `\0rb: \mapsto \text{Orb}`

`\Stab` `\Stab: \mapsto \text{Stab}`

`\Fix` `\Fix: \mapsto \text{Fix}`

Derivatives There are three derivative forms defined specifically for speeding calculus entry and accuracy. One used the dx form and two use the partial, ∂x , form.

`\deriv` `\deriv: {\langle y \rangle}{\langle x \rangle} \mapsto \frac{dy}{dx}`

`\pderiv` `\pderiv: {\langle y \rangle}{\langle x \rangle} \mapsto \frac{\partial y}{\partial x}`

`\psderiv` `\psderiv: {\langle y \rangle}{\langle x \rangle}{\langle z \rangle} \mapsto \frac{\partial^2 y}{\partial x \partial z}`

Additional symbols A couple of additional symbols are available for use in different modules, or purely for convenience.

`\rect` `\rect: \rect, \square`, is defined particularly for the use of M208 people although others may find it useful.

`\ld` `\ld: \lambda`, is another useful definition for M208 student who may be taxed by the number of times they need to type, and then correct their spelling of, `\lambda`. The macro will work correctly in both text and maths mode.
This is an ou-tma-sup macro.

`\Pounds` `\Pounds: {\value}` `\Pounds` displays a Pound Sterling amount in the appropriate format with two decimal places (rounded as necessary). For example `\Pounds{2.56}` renders as £2.56. *This is an ou-tma-sup macro.*

Statistics devices A common device in statistics is the ‘Five value statistic summary’, it is communicated via a standardised graphic.

`\FiveStats` `[\langle n \rangle]{\langle min \rangle}{\langle max \rangle}{\langle median \rangle}{\langle Q1 \rangle}{\langle Q3 \rangle}` `\FiveStats` uses TikZ to draw the appropriate diagram. For example:

`\FiveStats[30]{1}{10}{5.5}{3}{8}` results in

The count of values, n , is optional. *This is part of the ou-tma-sup package.*

Legacy elements There are a couple of macros which become enabled when using the `legacy` option. These are now deprecated and may be removed from a future version. There are name clashes with standard L^AT_EX commands, so please be aware of this if used.

`\C [legacy]` `\C:` is the original version of `\Complex`

`\vec [legacy]` `\vec:` is the original version of `\vect`

4 Implementation of ou-tma

```

Adapted by Peter McFarlane from various sources. All errors of style or content are mine or subsequent contributors. Acknowledgements to Bob Margolis and Rob

Lynas (from whom some macros are plagiarised). Further contributions from Steve Mayer and Tim Dale. Annotations, in part, and further modification by Geoff Riley.

Package Options

`\[alph]` (default) question numbering as 1(b)(iii)

`\[roman]` varies question numbering to sequence used by M381 i.e. 1(ii)(c)

`\[cleveref]` question numbering creates automatic referencing for use with cleveref package

`\[pdfbookmark]` add PDF bookmarks for each question using hyperref package

`\[legacy]` enables old definitions of `\vec` and `\C` for backward compatibility

To use a package option, place the option(s) before the package name:

```
\usepackage[roman,cleveref]{ou-tma}
```

Before getting into the main package, it is necessary to ensure that the L^AT_EX3 extensions are loaded. Most modern versions of the L^AT_EX core have this rolled in as standard, but as a belt and braces approach, inclusion here does no harm.

```
22 \RequirePackage{expl3} % LaTeX3 "experimental"
```

4.1 Package Initialisation

We are starting off using the `\ExplSyntaxOn` command to enable the L^AT_EX3 extensions before declaring a set of ‘constants’ that will be used by our package. Working with the established conventions the constants are declared as variables are named to reflect their ownership and function. These are all declared as ‘token lists’ so that they may, effectively, hold string elements. Make the underscore character a letter!

```
g_@@_constant_name g_@@_constant_name: holds the students personal name
```

```
(Var)
```

```
g_@@_constant_tma g_@@_constant_tma: holds the number of the TMA being answered
```

```
(Var)
```

```
g_@@_constant_course g_@@_constant_course: holds the OU course code for the module being studied
```

```
(Var)
```

```
g_@@_constant_pin g_@@_constant_pin: holds the students personal identification number
```

```
g_@@_constant_pin
```

```
(Var)
```

```
g_@@_constant_thedate g_@@_constant_thedate: holds the date to be printed on the front page of the
```

```
TMA
```

```
(Var)
```

```
23 % %%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
```

```
24 %% Package Initialization
```

```
25 % %%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
```

```
26 \ExplSyntaxOn
```

```
27 \tl_new:N \g_@@_constant_name
```

```
28 \tl_new:N \g_@@_constant_tma
```

```

29 \tl_new:N \g_@@_constant_course
30 \tl_new:N \g_@@_constant_pin
31 \tl_new:N \g_@@_constant_thedate

```

These ‘constants’ are given initial generic values.

```

32 \tl_gset:Nn \g_@@_constant_name {name}
33 \tl_gset:Nn \g_@@_constant_tma {tma}
34 \tl_gset:Nn \g_@@_constant_course {course}
35 \tl_gset:Nn \g_@@_constant_pin {pin}
36 \tl_gset:Nn \g_@@_constant_thedate {the~date}

```

Then commands are provided to retrieve the values when required.

`\name \name:` returns the students name

`\tma \tma:` returns the working TMA number

`\course \course:` returns the OU course reference

`\pin \pin:` returns the students personal identification number

`\thedate \thedate:` returns the date to be printed on the title page of the TMA

```

37 \newcommand{\name}{\g_@@_constant_name}
38 \newcommand{\tma}{\g_@@_constant_tma}
39 \newcommand{\course}{\g_@@_constant_course}
40 \newcommand{\pin}{\g_@@_constant_pin}
41 \newcommand{\thedate}{\g_@@_constant_thedate}

```

Finally, macros are provided to set the values of the ‘constants’: these should only be used within the preamble. Use within the body of the text is unpredictable.

`\myname \myname:` `{\langle name \rangle}` Set the students name

`\mytma \mytma:` `{\langle TMA number \rangle}` Set the TMA number

`\mycourse \mycourse:` `{\langle course code \rangle}` Set the OU course code for the module

`\mypin \mypin:` `{\langle pin \rangle}` Set the students personal identification number

`\setdate \setdate:` `{\langle the date \rangle}` Set the required date to display on the title page, default is the date of report generation

```

42 \NewDocumentCommand{\myname}{m}{%
43 \tl_gset:Nn \g_@@_constant_name{#1}}
44 \NewDocumentCommand{\mytma}{m}{%
45 \tl_gset:Nn \g_@@_constant_tma{#1}}
46 \NewDocumentCommand{\mycourse}{m}{%
47 \tl_gset:Nn \g_@@_constant_course{#1}}
48 \NewDocumentCommand{\mypin}{m}{%
49 \tl_gset:Nn \g_@@_constant_pin{#1}}

```

```

50 \NewDocumentCommand{\setdate}{m}{%
51 \date{#1}\tl_gset:Nn \g_@@_constant_thedate{#1}}

```

That's the end of the L^AT_EX3 extensions requiring the extension switch, so it can be turned off.

```

52 \ExplSyntaxOff

```

Set the `\title` and `\author` ready for use by the `\maketitle` macro at the start of the main document. They use the constants defined above so that changes are automatically reflected. They may be redefined by the user if required.

```

53 \title{\textbf{TMA: \course-\tma}}
54 \author{\textbf{\name\space\pin}}

```

In order to allow the question introduction string to be modified, a general L^AT_EX string is created along with a macro to set it.

`\tma@questionalignment` `\tma@questionalignment`: Holds the string alignment to the left margin, the default is 'r'. This is particularly useful for question strings that might otherwise extend beyond the left hand reach of the left hand page border.

`\tma@questionstring` `\tma@questionstring`: Hold the string to be printed before the question number, the default is 'Q'.

`\setquestionstring` `\setquestionstring`: [*char*]{*string*} Set the string to precede the question number

```

55 \NewDocumentCommand{\tma@questionalignment}{r}{
56 \NewDocumentCommand{\tma@questionstring}{\relax}
57 \NewDocumentCommand{\setquestionstring}{O{r} m}{%
58 \RenewDocumentCommand{\tma@questionalignment}{#1}%
59 \RenewDocumentCommand{\tma@questionstring}{#2}%
60 }

```

Set the default date to 'today'.

```

61 \setdate{today}

```

4.2 Package Loading

Here we load the useful packages that have proven their worth for OU students over the years. Many have properties that are utilised by the rest of the `ou-tma` package.

```

62 % %%%%%%%%%%%%%%%
63 %% Package Loading
64 % %%%%%%%%%%%%%%%
65
66 \RequirePackage{amsmath}
67 \RequirePackage{amssymb}

```

```

68 \RequirePackage{amsthm}
69 \RequirePackage{wasysym}
70 \RequirePackage{bm}
71 \RequirePackage{upgreek}
72 \RequirePackage{graphicx}
73 \RequirePackage{lastpage}
74 \RequirePackage{xifthen}
75 \RequirePackage{verbatim}
76 \RequirePackage{fancyhdr}
77 \RequirePackage{geometry}
78 \RequirePackage{calc}
79 \RequirePackage{etoolbox}
80 \RequirePackage[UKenglish]{isodate} % use UK format for date
81 \cleanlookdateon % remove th,st, rd from date
82

```

4.3 Geometry Settings

An important part of TMA answering is providing a consistent output, to this end the following page geometry has been brought together as a compromise suitable for most modules.

```

83 % %%%%%%%%%%%%%%%
84 %% Geometry Settings
85 % %%%%%%%%%%%%%%%
86
87 \geometry{
88   headheight=10mm,
89   headsep=5mm,
90   bottom=25mm,
91   footskip=15mm,
92   left=30mm,
93   right=30mm,
94   marginparwidth=0mm,
95   marginparsep=0mm,
96   includemp
97 }

```

4.4 Margin Notes

By default, no margin notes are assumed to be required, however, if one is wanted, `\marginnotes` the `\marginnotes` command will set up the side margin ready to accept notes using `\marginnote` the `\marginnote{\textit{note}}` command.

```

98 % %%%%%%%%%%%%%%%
99 %% Margin Notes
100 % %%%%%%%%%%%%%%%
101
102 \NewDocumentCommand{\marginnote}{m}{\marginpar{#1}}
103 \NewDocumentCommand{\marginnotes}{-}{
104   \geometry{
105     marginparwidth=40mm,

```

```

106     marginparsep=5mm,
107     left=20mm,
108     right=15mm
109 }
110 }

```

4.5 Question Numbering

We set up three counters to keep track of the question number along with associated parts and subparts.

question (*Ctr*) **question**: Holds the current question number, when a new question is started this value is used unless one is provided, in either case the used value is incremented as saved back here. When used, the `\qpart` is automatically reset so that the first part will be part 1.

qpart (*Ctr*) **qpart**: Holds the current part number as a numeric value, as with the question number this may be overridden and is incremented after being used. When used, the `\qsubpart` is automatically reset so that the first subpart will be sub-part 1.

qsubpart (*Ctr*) **qsubpart**: Holds the current sub-part number as a numeric value, again, the value may be overridden and is incremented after being used.

```

111 % %%%%%%%%%%%%%%%
112 %% Question Numbering
113 % %%%%%%%%%%%%%%%
114
115 \newcounter{question}
116 \newcounter{qpart}[question]
117 \newcounter{qsubpart}[qpart]

```

The question number is set to print as arabic digits,

```

118 \renewcommand{\thequestion}{\arabic{question}}

```

4.6 Option Handling

In order to handle the incoming options for the `ou-tma` package, we create a set of four new boolean tokens.

tma@roman (*bool*) **tma@roman**: False indicates ‘alph’ numbering, true indicates ‘roman’ numbering of parts and subpart.

tma@usecleveref (*bool*) **tma@usecleveref**: True indicates that the `cleveref` package is requested.

tma@usepdfbookmark **tma@usepdfbookmark**: True indicated that the `pdfbookmark` package is requested.
(*bool*)

`tma@legacy` (*bool*) `tma@legacy`: True indicted that the commands `\Complex` and `\vect` will be redefined to the legacy commands `\C` and `\vec`.

```

119 % %%%%%%%%%%%
120 %% Option Handling
121 % %%%%%%%%%%%
122 % Define boolean flags
123 \newif\iftma@roman
124 \newif\iftma@usecleveref
125 \newif\iftma@usepdfbookmark
126 \newif\iftma@legacy
127
128 % Set default options
129 \tma@romanfalse % Default numbering is 'alph'
130 \tma@useclevereffalse % Default is not to use cleveref
131 \tma@usepdfbookmarkfalse % Default is not to use pdfbookmark
132 \tma@legacyfalse % Default is not to use legacy definitions

```

We now set up the default states and commands for the ou-tma package operation.

`\theqpart \theqpart`: returns the current question part number as either an alpha or roman index.

`\theqsubpart \theqsubpart`: returns the current question subpart number as either a roman or an alpha index.

`\tma@crefname \tma@crefname`: $\{\langle label type \rangle\}\{\langle singular name \rangle\}\{\langle plural name \rangle\}$ Declares a label with singular and plural spellings for the `cleveref` package.

`\tma@stepcounter \tma@stepcounter`: $\{\langle counter name \rangle\}$ Increments the named counter by one.

`\tma@bookmark \tma@bookmark`: $[\langle level \rangle]\{\langle text \rangle\}\{\langle name \rangle\}$ The level is optional, numerical, the default is zero, the top level. The text is what will appear in the bookmark panel, and the name is what may be used as a reference to the location from other parts of the document.

`\tma@pageref \tma@pageref`: $\{\langle name \rangle\}$ returns the page number, if known, that contains the bookmark with the label name.

```

133 % Define commands with default values
134 \renewcommand{\theqpart}{\alph{qpart}}
135 \renewcommand{\theqsubpart}{\roman{qsubpart}}
136 \NewDocumentCommand{\tma@crefname}{mmm}{\relax}

5 Implementation of ou-tma-sup

```

1 %% ou-tma-sup.sty
2 %% Copyright 2025 G. I. Riley <geoffr@adaso.com>
3 %% This package may be freely used, especially by, but not limited to,
4 %% students, lecturers and staff of the Open University. It was created
5 %% by the efforts of many who are now or have been connected with the
6 %% Open University Students Association. No acknowledgement is
7 %% _required_ for using this package within the production of a _Tutor
8 %% Marked Assessment._

```

This is the OU TMA supplementary file. It's purpose is to contain commands that are less commonly used, probably used by only one or two modules; and for experimental commands that may be included for testing by a wider audience but may be deemed unnecessary in the long run.

```

9 % \RequirePackage{expl3} % Automatically loaded with the \ProvidesExplPackage
10 \RequirePackage{ou-tma} % main ou-tma package
11 \ExplSyntaxOn

```

This package provides macros for formatting numeric approximations, probability expressions, monetary values, and statistical diagrams, using expl3 and siunitx. It is intended for typesetting mathematics and statistics answers in OU TMAs.

5.1 Main formatting commands

`\tmadp` [*options*]{*value(s)*}[*units*]: Round to *<n>* decimal places

`\tmasf` [*options*]{*value(s)*}[*units*]: Round to *<n>* significant figures

value(s) (*Arg*) [*rounding*]: should be a comma separated lists giving either two or three numbers:

- {*x*, *n*} for one value to *n* dp/sf
- {*x*, *y*, *n*} for a range from *x* to *y* to *n* dp/sf

options (*Arg*) [*rounding*]: may be one or more pairs of strings joined by an equals sign. Currently defined are the mutually exclusive:

- `style=bracket` for bracketed range: (*x*, *y*)
- `style=to` (default) for range using: '*x* to *y*'

5.2 Other useful commands

`\prob {⟨event⟩}`: Formats $P(\text{event})$ when in maths mode. The event may contain logically connecting commands, `\and`, `\or`, `\bar` and `\not`, to build probability expressions so that expressions like

`$_\prob{(Journey A \or Journey B) \and Bus}$` may be set:
 $P((\text{Journey A } \text{or } \text{Journey B}) \text{ and Bus}).$

`\Pounds {⟨amount⟩}`: Formats an amount in pounds sterling with two dp, e.g. £3.45

`\FiveStats [⟨n⟩]{⟨min⟩}{⟨max⟩}{⟨med⟩}{⟨Q1⟩}{⟨Q3⟩}`: Draws a 5-number summary diagram using TikZ.

`n (Arg) [fivestats] n:` : (Optional) number of samples

`min (Arg) [fivestats] min:` : Extreme minimum value

`max (Arg) [fivestats] max:` : Extreme Maximum value

`median (Arg) [fivestats] median:` : Median average

`Q1 (Arg) [fivestats] Q1:` : First quartile value

`Q3 (Arg) [fivestats] Q3:` : Third quartile value

e.g. `\FiveStats[30]{1}{10}{5.5}{3}{8}`

5.3 Package Initialisation

```

12 \ExplSyntaxOff
13 \RequirePackage{amsmath}
14 \RequirePackage{ifthen}
15
16 \RequirePackage{siunitx}
17 \sisetup{per-mode = symbol}
18 \sisetup{uncertainty-mode = separate}
19
20 \RequirePackage{tikz}
21 \RequirePackage{pgfplots}
22 \pgfplotsset{compat=1.18}
23 \usepgfplotslibrary{units}
24 \usetikzlibrary{angles,
25     quotes,
26     calc,
27     arrows.meta,
28     positioning,
29     decorations.markings}

```

5.4 TikZ styles for solid and hollow dots

```

30 % %%%%%%%%%%
31 %% TikZ styles for solid and hollow dots
32 % %%%%%%%%%%

```

Create TikZ styles for solid and hollow dots: used to mark included and excluded points on number lines and graphs etc. For example $(2, 5] \cup [8, 10] \cup [12, 16)$:

```

33 \tikzset{
34   soliddot/.style={
35     fill=black,
36     draw=black,
37     circle,
38     minimum size=4pt,
39     inner sep=0pt,
40   },
41   hollowdot/.style={
42     fill=white,
43     draw=black,
44     circle,
45     line width=0.6pt,
46     minimum size=4pt,
47     inner sep=0pt,
48   },
49 }

```

5.5 Question subpart with extention

```

50 % %%%%%%%%%%
51 %% Question subpart with extention
52 % %%%%%%%%%%

```

Make a question subpart with an extension, eg: Q1.a.i-1

Usage:

`\qsubparte[n]{ext}`

- where **n** is an optional value to reset the counter, a decimal value, if omitted, or zero, then continues the previous count; and
- **ext** is the required extension string.

```

53 \NewDocumentCommand{\qsubparte}{0{0}m}{
54   {
55     \iftma@roman
56       \renewcommand{\theqsubpart}{\alph{qsubpart}-#2}
57     \else
58       \renewcommand{\theqsubpart}{\roman{qsubpart}-#2}
59     \fi
60     \qsubpart[#1]

```

```

61     }
62 }

```

`\tmadp` [*<options>*]{*<values>*}[*<units>*]

`\tmasf` [*<options>*]{*<values>*}[*<units>*]

Each of these macros follow the same format, they produce automatically rendered n decimal places or significant figures, and can optionally display ranges and units thereof. The values should be a comma separated list of two or three numbers, the last specifying the appropriate digit count. If two values are given then they represent a real number followed by the digit count; and if three values are given, then they represent a range of two real numbers followed by the digit count.

Zero padding is applied where needed, so:

`\tmadp(5.5,3)` correctly returns 5.500 (to 3 dp); and

`\tmadp[style=bracket]{2.25,7.25,2}[\gram]` returns (2.25 g, 7.25 g) (to 2 dp)

5.6 Macros to render appropriate decimal places and significant figures

```

5.10 Regular Polygons and Star Polygons in Mathematics Mode

The `ou-tma-sup` package provides commands for typesetting regular polygons and regular stars directly in mathematics mode. These symbols are constructed with TikZ and designed to harmonise with the height and visual weight of standard mathematical symbols.

All figures produced by the commands in this section:

- sit on the mathematics baseline;
- have symbol-sized versions approximately one x-height tall;
- have enlarged operator versions spaced as `\mathbin`;
- support both outline and filled variants via TikZ options;
- include regular n -gons and star polygons $\{n/k\}$.

`\mregularpolygon` `\mregularpolygon[<tikz-options>]{<n>}`

Produces a regular polygon with $\langle n \rangle$ sides, drawn as a symbol-sized mathematical object. The optional argument allows arbitrary TikZ drawing options such as `draw=blue`, `thick`, or `fill=gray!20`.

`\mregularpolygonfill` As `\mregularpolygon`, but filled by default.

`\moctagon` A convenience macro expanding to `\mregularpolygon{8}`, useful in group-theoretic notation such as $\$S(\text{m octagon})\$$.

`\mregularpolygonop` A binary-operator-sized version of a regular $\langle n \rangle$ -gon. These symbols behave as `\mathbin`. Their enlargement factor can be adjusted by redefining the internal macro `\ou@tma@regularpolygonopscale`.

`\mregularpolygonfillop` As `\mregularpolygonop`, but filled by default.

`\mregularstar` `\mregularstar[<tikz-options>]{<n>}{<k>}`

Produces the regular star polygon $\{n/k\}$, using the same baseline and height conventions as regular polygons.

`\mregularstarfill` As `\mregularstar`, but filled.

`\mregularstarop` Binary-operator-sized version of the star polygon $\{n/k\}$.

`\mregularstarfillop` Filled variant of the operator-sized star polygon.

`\mpentagram` Convenience macro expanding to the star polygon $\{5/2\}$.

Example usage:

```

$S(\moctagon)$
$G \moctagonop H$
$\mregularstar{5}{2}$
$\mregularstarfillop{7}{3}$

6.2 Public API (document commands)

`\DocChangeDeclareStreams` `\DocChangeDeclareStreams: {<change sets>}` Comman separated list of change sets required.

`\DocChangeSet` `\DocChangeSet: {<change set>}` Set the active change set.

`\DocChangeClear` `\DocChangeClear:` Save the current change set.

`\DocChangePush` `\DocChangePush: {<change set>}` Switch to the indicated change set, but remember which was active before.

`\DocChangePop` `\DocChangePop:` Restore the previously active change set.

`\DocChangeSingleColumnOn` `\DocChangeSingleColumnOn:` Set single column glossary printing.

`\DocChangeSingleColumnOff` `\DocChangeSingleColumnOff:` Set double column glossary printing.

`\DocChangePrint` `\DocChangePrint: [(title)]{<change set>}` Print the change set as a glossary using the provided title.

```

Changes for ou-tma

v1.12 – 2024-11-08

General: Standardized package name to 'tma' to make it compatible with CTAN.
 Avoided redefining standard L^AT_EX commands. Consolidated geometry settings. Adjusted loading order of packages. Improved code readability and comments. Added 'legacy' option to allow old definitions of `\vec` and `\C`. 10

v1.13 – 2024-11-16

General: Arranged for `\qsubpart` to go on the same line as the `\qpart` when there is no intervening text `\qsubpart` indents further than `\qpart`. 10

v1.14 – 2024-11-17

General: Allow replacement of Question marker tag using `\setquestionstring`.
 References with `cleveref` not working. Replaced my attempts at keeping `\qpart` and `\qsubpart` on the same line with Steve Mayers contribution. 10

v1.15 – 2024-11-21

General: Define `\setdate` and `\thedate` to allow the header date to be used within the document, eg header and footer. 10

v1.16 – 2024-11-22

General: Added File Properties to pdf files using the hyperref setup system when in pdfbookmark mode. 10

v1.17 – 2025-02-13

General: Rewritten with L^AT_EX3 syntax from the 'xparse' package to make commands less fragile. Finally, I got the alignment of part and subpart numbering to line up correctly. 10

v1.18 – 2025-02-16

General: PDF metadata doesn't set correctly so I have removed it: the cause is an incompatibility between L^AT_EX unicode and the PDF restricted character allowance. 10

v1.19 – 2025-02-18

General: PDF metadata (apparently) was solved with help from Steve Mayers; all down to the use of commands as string containers. New (L^AT_EX3) commands are robust and fail to expand within the context of the metadata and bookmarks; old (L^AT_EX2e) commands are fragile and correctly expanded. I have a mix of old commands and new variables now. 10

v1.20 – 2025-04-07

General: Package name changed from 'tma' to 'ou-tma' to become a little more descriptive and to abide by the minimum package name length suggested by CTAN. 10

v1.21 – 2025-09-30

General: Documentation error spotted and corrected in very first example. A couple of other occurrences also corrected in less conspicuous places. . . 3

v1.21.1 – 2025-10-10

General: Adjustment of kerning in `\perm` suggested by Peter Osment . . . 19

Typo notified just after previous errors corrected. Minor error in `\setquestionstring` instead of `\setquestionstring`. 4

v1.21.2 – 2025-10-28

General: Added alignment variation for question string, suggested by Bruce

Ramsey.	4, 12, 18
v1.21.3 – 2025-11-12	
General: Experimental extentions to theorem code allowing a name to override the given number, and for an automatic label to be appllied using the name.	20
v1.21.4 – 2025-11-17	
General: Added functions <code>\MakePrivateLetters</code> and <code>\ClearPrivateLetters</code> to allow <code>expl3</code> elements to be indexed.	10
v1.21.5 – 2025-11-19	
General: Started updateing code to use the double-at prefixes to the localised code.	10
v1.21.6 – 2025-12-15	
General: Added group theory notation for generators and order.	8, 19
Removed experimental theorem code returning the original AMS theorem, lemma and corollary definitions.	20

Changes for ou-tma-sup

v0.12 – 2025-10-28	
General: Added <code>\FiveStats</code> for setting statistic summaries	27
Added <code>\Pounds</code> for setting Pound Sterling	27
Added <code>\prob</code> for setting probability texts	28
Added <code>\qsubparte</code> to allow a suffix on a question subpart	23
Added <code>\tmadp</code> and <code>\tmasf</code> for setting d.p. amd s.f. texts	24
Added <code>TikZ</code> styles for solid and hollow dots used in inclusive and exclusive number lines	22
Added shortcut <code>\ld</code> for <code>\lambda</code>	32
Added shortcuts for plus and minus flags used in sign tables.	32
v0.14 – 2025-11-25	
General: Added polygon routines for entering symbols such as octagons directly in maths mode.	29

Changes for doc-changes

0.3 – 2025-11-13	
General: Documenting Public API	35

Index

Numbers written in *italic* refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
